

In-Context Learning for Discrete Optimal Transport: Can Transformers Sort?

Hadi Daneshmand  UNIVERSITY
of VIRGINIA

How do transformers translate?

OT Problem

- ▶ Optimal transport:

$$P^* := \arg \min_P \sum_{ij} \|x_i - y_j\|^2 P_{ij} \text{ subject to } P \text{ is a permutation matrix}$$

- ▶ Permutation matrix: $P \in \mathbb{R}^{n \times n}$, $P_{ij} \in \{0,1\}$, $\sum_{j=1}^n P_{ij} = 1$

- ▶ Applications: sorting, cell perturbation analysis, reviewer/paper matching, ...

4

- $$P^* := \arg \min_P \sum_{ij} \|x_i - y_j\|^2 P_{ij} \text{ subject to } \dots \rightarrow$$

Attention, OT, translation

5

- ▶ Attention weights converge toward the OT solution across layers

▶ Layer 1

▶ Layer 6

▶ Layer 12

▶ OT of embeddings

Main Result

Theorem (informal statement)

A transformer with ℓ softmax attention layers can approximate OT up to error

$$\frac{\sqrt{n}}{\sqrt{\ell}} \times \text{data dependent and regularization constants}$$

Dual objective of OT

7

Entropy Regularized OT: $P_\lambda = \arg \min_P \sum_{ij} \|w_i - w'_j\|^2 P_{ij} + \lambda \underbrace{\sum_i \sum_j P_{ij} \log(P_{ij})}_{-entropy}$

Dual: $\min_{u_i, v_j} L(u, v) = \lambda \sum_{ij} e^{\frac{-\|w_i - w'_j\|^2 + u_i + v_j}{\lambda}} - 1 - \sum_i v_i - \sum_j u_j$

Mechanism of Attention for Translation

- ▶ Attention layers can simulate GD with adaptive step sizes on the dual function L
